LeadFlow AI

Multilingual commerce lead & order agent on AMD GPUs (Token Factory · MI300X-ready)

heavycastles · `github.com/heavycastles` · Track: Reinvent Commerce

lablab.ai AMD Developer Hackathon: ACT III

Problem

SMB shops in Central Asia sell via **Telegram / WhatsApp**.

- 3 languages (RU / UZ / EN) mixed in one inbox
- Dozens of messages per day
- Slow replies = lost buyers

> One missed “хочу купить” at peak hour costs a sale.

Solution

An agent that sits between the shop’s channels and the owner:

1. **Reads** every incoming message
2. **Extracts** intent, products, quantities, budget, urgency
3. **Replies** in the customer’s language
4. **Ranks** leads with an explainable hybrid score
5. **Drafts** orders when the buyer is ready

```
message → n8n → FastAPI → CommerceAgent → AMD Token Factory (or vLLM@MI300X) → reply + score
```

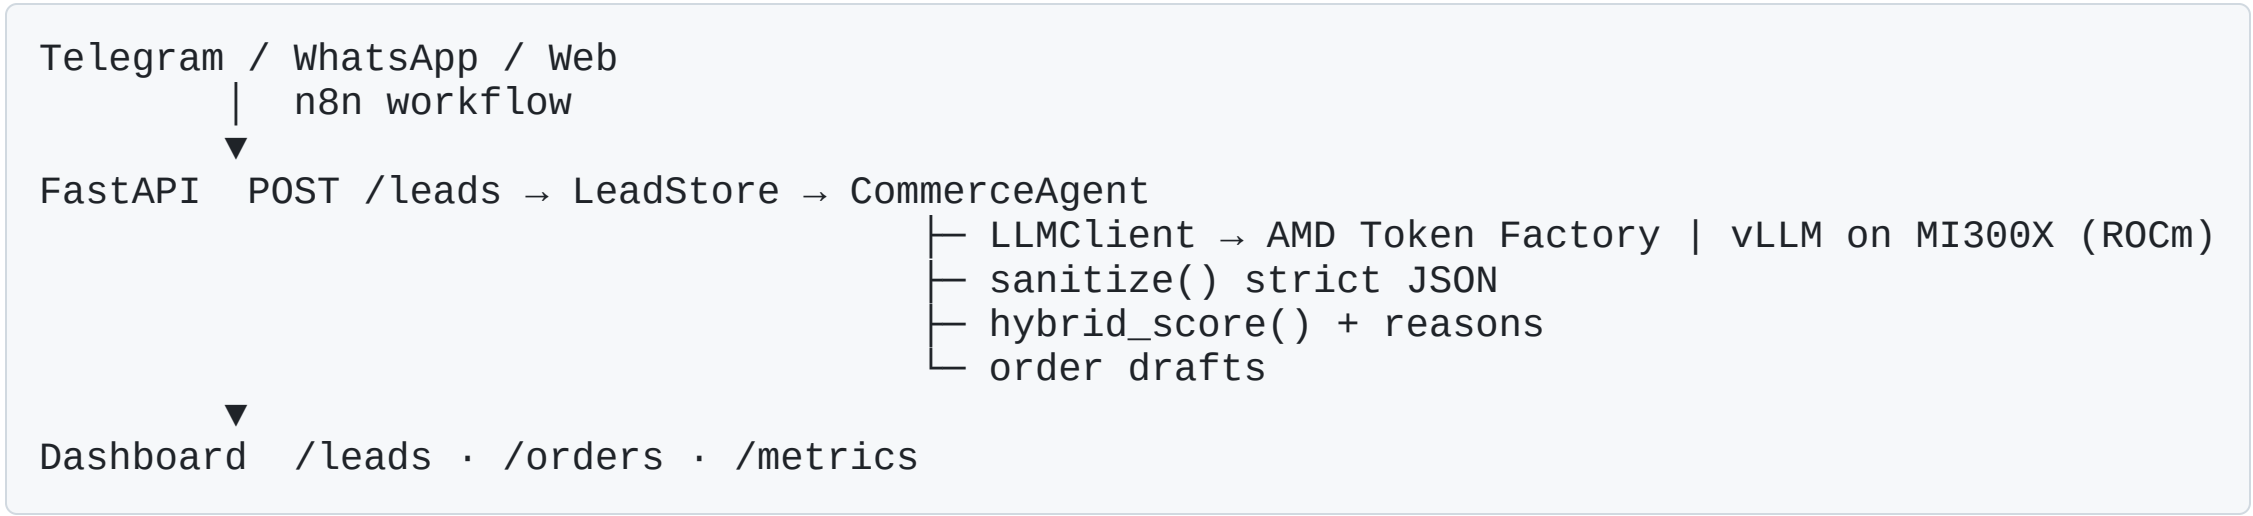

Live demo (dashboard)

Ranked leads · reasons · reply drafts · order drafts · tok/s panel

- Hot lead ping to the shop owner
- FALLBACK badge when GPU is unreachable
- Metrics: latency, aggregate tok/s, backend, fallbacks

(Recorded demo / screenshots go in the submission video.)

Architecture

Graceful degradation: offline analyzer if the GPU endpoint fails.

Why AMD

Layer	Choice
Live API	**AMD Token Factory** (AMD GPUs, OpenAI-compatible, one key) — DeepSeek-V4-Flash
Self-hosted	AMD Instinct **MI300X** (192 GB HBM3) · **ROCm** + `rocm/vllm` · Qwen2.5-7B (70B-class fits)
Workload	intent · entities · multilingual reply drafting

Live on AMD Token Factory (one key). Optional self-hosted MI300X benchmark — TBD if credits are used:

model	conc.	req/s	tok/s	latency	intent acc.
Qwen2.5-7B-Instruct (MI300X)	8	**TBD**	**TBD**	**TBD**	**TBD**

Trust & explainability

- **Hybrid score** = deterministic rules + model features
- Every point has a **human-readable reason**
- Model JSON is **strictly validated** and clamped
- No LLM-only decisions; degrades instead of lying

Business value

- SaaS: per shop / month
- Time saved per message; conversion uplift hypothesis
- Market: UZ / KZ e-commerce via messengers
- One MI300X → many tenants or a larger model (no sharding)

Roadmap

1. WhatsApp Business API
2. Catalog / stock lookup (RAG)
3. Payments (Click / Payme)
4. Fine-tuned Uzbek model on MI300X
